

Admin Console SuperAdmin Manual

Every screen, role and control in the PRDF Loan Management System

Document	Admin Console — SuperAdmin Manual
Version	1.0
Date	26 September 2026
Audience	SuperAdmin and Admin users
Console	https://prdf-admin.vercel.app
Companion	PRDF Client Portal — User Manual v1.0
Purpose	Operating manual and handover record

Every screenshot was captured from the working system by walking a real application from submission to disbursement. Figures are test data. Personal data on the User Access screen has been masked.

Contents

1	About this manual	13	Money tab — disbursement
2	The system at a glance	14	Money tab — repayments
3	Roles and what each can do	15	History, Tasks, Notes, Advisory
4	Signing in and access control	16	Loans and Portfolio
5	The application lifecycle	17	Reports
6	Dashboard	18	User Access
7	Pipeline	19	My Profile and notifications
8	The case file — Overview	20	What the client sees
9	Documents tab	21	Configuration without a release
10	Advancing a case	22	Environments and operations
11	Pricing tab and the risk grade	23	Known limitations
12	The credit model in full	24	Acceptance and sign-off

How to use this manual

Sections 2–5 explain how the system is put together — read these once. Sections 6–19 follow the console screen by screen and are the day-to-day reference. Sections 20–23 are for whoever owns and operates the system. Section 24 is the acceptance record.

A worked example runs through the whole manual. Application #b3bfecaa — Blue Harvest Aquaculture (Pty) Ltd, R750 000 over 12 months — was taken from submission to disbursement to produce these screenshots. You can follow the same case from Section 7 to Section 14 and see every figure reconcile.

1. About this manual

This manual documents the PRDF Admin Console as a SuperAdmin sees it — which is everything. It covers every screen, every tab, every control, and the rules behind them. Where a rule is enforced by the database rather than the interface, that is said explicitly, because those are the rules you cannot talk your way around.

1.1 What a SuperAdmin can do that others cannot

- See every case regardless of who it is assigned to
- Drive any status transition, overriding the role that normally owns that stage
- Grant and remove roles, including Admin
- Reset a user's multi-factor authenticators
- Move money — disburse and record repayments
- Read every report and the audit trail

The override is the dangerous part. A SuperAdmin can advance a case past a stage its owning role has not signed off. The system will let you; the audit trail will record that you did. Use the override for genuine operational recovery, not to save a colleague a phone call.

1.2 Companion documents

Document	Covers
PRDF Client Portal — User Manual	The applicant's side in full. Section 20 summarises it
<code>docs/qa-test-manual.md</code>	QA walkthroughs and test accounts
<code>docs/credit-model-phase1-plan.md</code>	The money model, its rules and its history
<code>docs/roles-and-access.md</code>	Role definitions
<code>docs/runbook.md</code> , <code>docs/support.md</code>	Operations and common failures

2. The system at a glance

PRDF runs two web applications against one API and one database.

Part	Address	Who uses it
Admin Console	<code>https://prdf-admin.vercel.app</code>	Internal and workflow staff
Client Portal	<code>https://prdf-lms.vercel.app</code>	Applicants holding the <code>Client</code> role
API	<code>https://prdf-api.vercel.app</code>	Both front ends
Database, auth, storage	Supabase project <code>prdf</code>	The API

2.1 How a request is authorised

1. You sign in against **Supabase Auth**, which issues a signed token.
2. The console sends that token with every API call.
3. The API verifies it, loads your roles from the database, and checks them against the action.
4. **Row-level security** in the database checks again, independently.

Two gates, deliberately. The interface hides what you may not do, but the interface is not the control — the API is directly callable. Anything enforced only in the browser is advisory. This is why some rules below say "enforced by a database trigger": those hold even if someone calls the API directly.

2.2 Where documents live

Uploaded files go straight from the applicant's browser to a private storage bucket using a short-lived signed URL. The API never handles the file itself; it records that the document exists and validates its type and name. Files are only ever served back through signed links that expire.

2.3 Multi-tenancy

The platform is built to serve more than one lender. Branding, eligibility copy and domains come from a tenant configuration resolved from the hostname at page load. There is deliberately **no default tenant** — an unrecognised hostname shows an error rather than serving the wrong brand.

3. Roles and what each can do

There are eight workflow roles, plus management and administrative roles, plus the client.

3.1 Workflow roles

Each owns one stage of the review chain and sees only the cases assigned to them.

Role	Owns the stage	Responsible for
Intake Clerk	Submitted	Confirming intake and mandatory documents
Program Officer	Screening	Initial screening and compliance checks
Risk Analyst	Due Diligence	Financial and risk assessment — sets the risk grade
Review Committee	Evaluation	Viability and mandate alignment
Program Manager	Evaluation (shared)	Decision-making; may decline at any stage
Board	Approved	Authorising funding; may decline at any stage
Legal	Board Approved	Generating and issuing the loan agreement
Finance Officer	Contracting, Disbursed, In Repayment	Paying out and recording repayments

3.2 Management and administrative roles

Role	What it means
SuperAdmin	Everything, including granting Admin and resetting MFA
Admin	Full case access and any transition; manages user roles
Program Manager, Board	Full case visibility, reports and audit
Client	The applicant. Cannot enter the console at all

3.3 The rules that matter

- **Only Finance Officer, Admin and SuperAdmin may move money.** Anyone else attempting to disburse or record a repayment is refused by the API.
- **Only a SuperAdmin may grant Admin.**
- **The Client role cannot be assigned from the console at all** — it is granted when someone registers in the portal. This is deliberate: a staff member must not be able to turn a colleague into a borrower.
- **A Client-only user is blocked from the console**, and a user with no Client role is blocked from the portal.
- Stage workers see only cases assigned to them. Management roles see everything.

4. Signing in and access control

Welcome Back

Sign in to continue managing applications and loans.

Email

Password

Sign In

Forgot password?
Staff accounts are created by an administrator.
Contact one to request access.

Figure 1 — The console sign-in. Staff accounts are created by an administrator; there is no self-registration.

Sign in with your PRDF email address and password. Your session persists across browser restarts and expires after a period of inactivity. **Logout** is at the top right of every screen.

4.1 If someone cannot get in

Symptom	Cause and fix
"Access restricted" after signing in	The account has no internal role — only <code>Client</code> . Grant them a role in User Access (Section 18)
Sign-in rejected	Wrong password, or the account does not exist. Staff accounts are created by an administrator
Signed in but every page fails to load	The console cannot reach the API. See Section 22
Locked out of a second factor	Use Reset MFA in User Access so they can enrol a new device

4.2 Layout

The left sidebar holds the six destinations: **Dashboard, Pipeline, Loans, Portfolio, Reports, User Access**. The top bar shows who you are signed in as, an alerts bell, your **Profile**, and **Logout**. A breadcrumb above the page title shows where you are.

What you see depends on your roles. A Finance Officer does not see User Access; a stage worker sees a shorter Pipeline. This manual describes the SuperAdmin view, which is the complete one.

5. The application lifecycle

Every application moves through a fixed sequence of eleven stages. The rail at the top of each case shows where it is.

Draft → Submitted → Screening → Due Diligence → Evaluation → Approved
→ Board Approved → Contracting → Disbursed → In Repayment → Closed

Two branches leave the main line at almost any point:

- **Info Requested** — more is needed from the applicant. Returns to Submitted or Screening once supplied.
- **Rejected** — the application is declined. Available from every stage up to Contracting.

5.1 Who may advance what

From stage	Next	Owned by
Draft	Submitted	The applicant
Submitted	Screening, Info Requested, Rejected	Intake Clerk
Screening	Due Diligence, Info Requested, Rejected	Program Officer
Due Diligence	Evaluation, Info Requested, Rejected	Risk Analyst
Evaluation	Approved, Rejected	Review Committee / Program Manager
Approved	Board Approved, Rejected	Board
Board Approved	Contracting, Rejected	Legal
Contracting	Disbursed	Finance Officer
Disbursed	In Repayment	Finance Officer
In Repayment	Closed	Finance Officer

Illegal jumps are refused by the database, not just the interface. You cannot move a case from Submitted straight to Approved even by calling the API directly — a trigger rejects the write. The dropdown only ever offers the transitions that are actually legal from the current stage.

5.2 Two gates worth knowing

- **Submission** requires every required document type to be present. Enforced by trigger.
- **Approval** requires every required document to be *Verified*, not merely uploaded. Enforced by trigger. This is the single most common reason an approval is refused — see Section 9.

5.3 When the loan record is created

The loan is created when the case reaches **Board Approved**, in `PendingDisbursement` status. That is the moment the rate, days financed and fees are fixed — see Section 11.

6. Dashboard

Figure 2 — The dashboard. Four counters, your assigned queue, and tasks due today.

Counter	What it counts
Pipeline Cases	Every open case you can see
In Review	Cases between Screening and Evaluation
Info Requested	Cases waiting on the applicant — these are stalled and need chasing
SLA Breached	Cases sitting longer than the service standard. Highlighted amber

Assigned Queue lists the cases you can act on, newest first, each with its amount, when it last moved, and its status. Click any row to open it. **Tasks Due Today** shows action items assigned to you (Section 15).

Read the SLA counter daily. It is the only place the console volunteers that work is ageing. A case can sit correctly assigned and entirely untouched for weeks without anything else flagging it.

7. Pipeline

The screenshot shows the 'PIPELINE' dashboard. On the left is a sidebar with 'PRDF ADMIN' and navigation links: Dashboard, Pipeline (selected), Loans, Portfolio, Reports, and User Access. The main header includes 'Dashboard > PIPELINE', 'Signed in as Test SuperAdmin', and buttons for 'Profile', 'Alerts (0)', and 'Logout'. The 'PIPELINE' section has a search bar and filter chips: 'All open' (selected), 'Screening', 'Due Diligence', 'Evaluation', 'Info Requested', 'Approved', 'Contracting', and 'SLA Breached'. A list of cases follows, each with a title, amount, date, and status badge. The first case is 'Purchase Order: Funding a confirmed purchase order to supply 40 tonnes of farmed abalone to an export buyer, covering feed, grading and cold-chain packaging over the contract period.' with amount 'R 750 000,00', date 'Updated 25/09/2026, 21:08:43', and status 'Submitted'. Other cases include 'Purchase Order: Delivery' (Draft), 'Purchase Order Funding — wholesale stock order (Moderate, 17%, 90 days)' (Approved), 'Short-Term Contract Funding — infrastructure sub-contract (Worst, 21%, 730 days)' (SLA breached - 17d, Evaluation), 'Short-Term Contract Funding — seasonal agri inputs (High, 19%, 365 days). Risk grade set at Due Diligence.' (SLA breached - 19d, Due Diligence), 'Short-Term Contract Funding — logistics contract working capital (Moderate, 17%, 180 days)' (SLA breached - 21d, Screening), and 'Purchase Order Funding — supply of manufactured goods (Excel worked example: Low grade, 15.5%, 90 days)' (SLA breached - 23d, Evaluation).

Figure 3 — Pipeline. Search by purpose or applicant; filter by stage with the chips.

Pipeline is the full case list. The filter chips are **All open**, **Screening**, **Due Diligence**, **Evaluation**, **Info Requested**, **Approved**, **Contracting** and **SLA Breached**. Cases past their service standard carry a red *SLA breached · n days* badge.

7.1 The preview drawer

This screenshot shows the same Pipeline dashboard as Figure 3, but with a 'CASE PREVIEW' drawer open on the right. The drawer is for 'BLUE HARVEST AQUACULTURE (PTY) LTD' (Test Client · R 750 000,00 · #0ddc6cd0). It displays a lifecycle rail with six stages: 1. Draft (checked), 2. Submitted (active), 3. Screening, 4. Diligence, 5. Evaluation, and 6. Appro. The case was submitted on 25/09/2026 at 21:08:43. At the bottom of the drawer are two buttons: 'Open full case →' and 'View documents'. The background dashboard is dimmed.

Figure 4 — Clicking a row opens a preview: applicant, amount, reference, and the lifecycle rail.

The preview is for triage — checking where something is without losing your place in the list. **Open full case →** goes to the case file; **View documents** jumps straight to its Documents tab.

Figure 5 — The case file. Lifecycle rail across the top, guidance and actions on the left, eight tabs on the right.

Every case has the same three parts.

8.1 The lifecycle rail

Eleven numbered stages. Completed stages carry a tick, the current one is highlighted, the rest are greyed. This is the authoritative view of where a case stands.

8.2 The left rail

The top card is **stage-aware guidance** — it changes as the case moves, and tells you what this stage expects. Beneath it, **Case actions**:

Control	What it does
Assign to	Assigns the case to a staff member. Click Save assignment to apply
Change status	Offers only the transitions legal from the current stage
Status note	Optional, but see the advice in Section 10
Update status	Applies the transition
Request info	Sends the case back to the applicant with a note saying what is missing

8.3 The eight tabs

Tab	Contents	Section
Overview	Applicant, business, amount, term, purpose, dates	8
Documents	Uploaded documents, inline viewer, verify and reject	9
Pricing	Credit-model quote and the risk grade decision	11
Money	Disbursement, repayments, schedule	13–14
Tasks	Action items against the case	15

Notes	Internal notes	15
History	Full audit trail of transitions	15
Advisory (NFS)	Non-financial support sessions logged	15

9. Documents tab

Figure 6 — The Documents tab. Chips across the top are the document types; the selected one opens in an inline viewer.

Each chip carries a status dot. Selecting one loads the file in a viewer so you can read it without downloading. Beneath the viewer: **Download**, **Full screen**, **Verify** and **Reject**.

9.1 The ten required documents

Document	Several files?
ID Document	No
Proof of Address	No
Company Registration (CIPC)	No
Tax Clearance	No
Bank Statements (last 3 months)	Yes
Financial Statements	No
Vendor Quotations (3x)	Yes
Central Supplier Database (CSD) Reports	No
Purchase Order / Short Term Contracts	No
Trade Reference	No

9.2 Verifying

Figure 7 — After verifying: the badge turns green, the chip dot turns green, and only **Reject** remains.

Approval is blocked until every required document is Verified. Uploaded is not enough — a database trigger checks for at least one *Verified* document of each required type when a case moves to Approved, and refuses the transition otherwise. If an approval is rejected and the reason is not obvious, this is almost always why.

9.3 Rejecting and requesting more

Reject marks a document as not accepted; the applicant sees the rejected badge in their portal and can upload a replacement. To ask for something the applicant has not provided at all, use **Request info** in the left rail — type what is missing and click **Request more info**. The case moves to Info Requested and the applicant is notified.

Be specific in the request. "Bank statements unclear — please upload the full three months including August" gets a useful answer. "More info needed" produces another round trip and another week.

Assignment saved.

Figure 8 — Assign the case, choose the next status, add a note, then **Update status**.

10.1 The sequence

1. Assign the case to whoever owns the next stage, and click **Save assignment**.
2. Choose the next status from **Change status**.
3. Write a status note saying what you checked and why you are moving it.
4. Click **Update status**.

Write the note every time. It is optional and it is the single most valuable thing in the case file. The History tab becomes the audit trail of the decision — and when a case is queried months later, or reviewed externally, notes are the only record of *why*. "Approved at R750 000 over 12 months at 17.00% (Moderate). All required documents verified." takes ten seconds and answers every future question.

11. Pricing tab and the risk grade

The Pricing tab does two different things, and the difference matters.

- The **quote** is a calculator. It computes and shows; it stores nothing.
- The **risk grade decision** is stored on the application, and is what the loan is actually booked at.

11.1 The inputs

Input	Notes
Principal (R)	Pre-filled from the requested amount
Days financed	Pre-filled from the term (365 ÷ 12 × months). Check it — it drives the interest
Risk grade	Low, Moderate, High or Worst. Sets the margin over Prime
Days late	For modelling a penalty. Leave at 0 for a normal quote

11.2 Saving the grade

Calculate quote

Risk grade decision
Saved as Moderate. The loan will be booked at this grade when the case is approved.
Grade saved

Annual rate	17.00%
Interest	R 127 500,00
Initiation fee	R 1 000,00
Management fee	R 22 500,00
Penalty	R 0,00
Total due to funder (principal + interest, excl. fees)	R 877 500,00
Total fees	R 23 500,00
Total client revenue (excl. capital)	R 151 000,00

Late-payment scenarios

DAYS LATE	PENALTY	TOTAL REVENUE
30	R 17 550,00	R 168 550,00
60	R 35 100,00	R 133 400,00
90	R 52 650,00	R 203 350,00

Figure 16 — Graded Moderate and quoted. The panel confirms "Saved as Moderate. The loan will be booked at this grade when the case is approved."

Choose the grade, click **Calculate quote** to check the numbers, then **Save grade as** The grade is stored against the application and audit-logged.

Grade the case before it reaches Board Approved. The loan is created at that point, at whatever grade is stored. If nothing is stored, it falls back to the legacy flat product rate and the case is booked at the wrong price. The warning on an ungraded case exists for exactly this reason.

The grade locks once the loan exists. After Board Approved the panel reads "This case is booked at ... The grade is now fixed — a booked loan keeps the rate it was priced on," and the save button is disabled. A booked rate is a snapshot; re-grading afterwards would disagree with what the client was told.

12. The credit model in full

Four income streams, one of which only applies when a client pays late. Capital is never revenue.

Component	Formula	When
Interest	$\text{Principal} \times \text{annual rate} \div 365 \times \text{days financed}$	Over the term
Initiation fee	Flat R1 000	Once-off
Management fee	$\text{Principal} \times 3\%$	Once-off
Penalty	$(\text{Principal} + \text{interest}) \times 2\% \times (\text{days late} \div 30)$	Only when late

12.1 The rate

Annual rate = **Prime + the risk grade's margin**. Prime is currently 10.5%.

Grade	Margin	Annual rate
Low	5.0%	15.5%
Moderate	6.5%	17.0%
High	8.5%	19.0%
Worst	10.5%	21.0%

12.2 Bullet, not amortising

Interest is simple, charged daily on the *full* principal, and frozen at maturity. There is no declining balance. The client makes **one payment at maturity** covering capital plus interest, so the repayment schedule has a single row.

12.3 Fees are deducted from the advance

The once-off fees are taken off the money paid out, not added to the schedule. This is why the model defines *total due to funder* as principal + interest and excludes fees.

12.4 The worked example

Item	Amount	How
Principal	R750 000,00	Requested
Annual rate	17.00%	Prime 10.5% + Moderate 6.5%
Days financed	365	$12 \text{ months} \times 365 \div 12$
Interest	R127 500,00	$750\,000 \times 17\% \div 365 \times 365$
Initiation fee	R1 000,00	Flat
Management fee	R22 500,00	$750\,000 \times 3\%$
Net advance	R726 500,00	$750\,000 - 23\,500$ — <i>pay out this</i>
Due at maturity	R877 500,00	$750\,000 + 127\,500$
Total client revenue	R151 000,00	$127\,500 + 23\,500$

12.5 Late payment

There is **no grace period**; penalty accrues from the first day late, linearly, and never compounds on earlier penalties. For the example above:

Days late	Penalty	Total revenue
30	R17 550,00	R168 550,00
60	R35 100,00	R186 100,00
90	R52 650,00	R203 650,00
120	R70 200,00	R221 200,00

Rounding is up to the cent. This can differ from the client's spreadsheet by a cent on some totals. It is a deliberate configuration, not a defect.

13. Money tab — disbursement

Once a case reaches Contracting the left rail reads "Ready for payout" and offers **Go to Money** →.

Figure 17 — The Money tab before paying out. Note the rate with its grade, the days financed, both fees, and the net advance.

Figure	Meaning
Outstanding	Capital still owed
Principal	The amount advanced
Scheduled Due	Total of the schedule — capital plus interest
Interest Rate	The booked annual rate, with the grade beneath it
Term	Months, with days financed beneath
Status	PendingDisbursement, Disbursed, InRepayment or Closed
Initiation / Management fee	The once-off fees, snapshotted at booking
Net advance	What to actually pay out — principal less the fees

Pay out the net advance, not the principal. For a R750 000 loan the client receives **R726 500**; the R23 500 of fees is retained. The field is labelled "pay out this amount" for that reason, and the console will not let you disburse more than it.

13.1 Disbursing

1. Enter the **Amount** — the net advance.
2. Enter a **Reference** — use the bank's payment reference so the two records reconcile.
3. Click **Disburse**.

Repayments
No repayments
No repayments have been posted yet.

Figure 18 — After disbursing. Status **Disbursed** , Scheduled Due R877 500, and a single bullet instalment due at maturity.

Disbursing does four things at once: records the payment, sets the loan to **Disbursed** , moves the application to Disbursed, and generates the repayment schedule. The applicant sees all of it immediately in their portal.

Disbursement is not reversible from the console. There is no undo. Check the amount and the reference before clicking.

14. Money tab — repayments

14.1 The repayment schedule

For a credit-model loan the schedule is a single row: the full principal plus interest, due on the maturity date. Each row shows its number, due date, amount due, amount paid, and status (Pending , Paid or Overdue).

14.2 Recording a repayment

1. Enter the **Amount** received.
2. Enter the **Payment reference** from the bank statement.
3. Click **Record**.

The payment is applied to the oldest unpaid instalment first, split into principal and interest components, and the outstanding balance reduces. Partial payments are allowed — the instalment stays Pending until fully covered.

Repayments have not been exercised end to end. The repayment path against a bullet schedule was not tested during handover. Record the first live repayment with care and confirm the resulting balance before relying on it. This is item 5 in Section 23.

14.3 Moving a loan through repayment and closure

Advance the case from Disbursed to **In Repayment** once collection begins, and to **Closed** when the loan is fully settled. Both are Finance Officer transitions on the left rail.

Repayments are collected by debit order, as the client agrees in their consent declaration. The portal has no payment function by design; the console is where receipts are captured.

15. History, Tasks, Notes and Advisory

15.1 History — the audit trail

Figure 19 — Every transition, timestamped, with the note written at the time. This is the case's permanent record.

History is appended to automatically and cannot be edited. It is what you produce when a decision is queried — which is the argument for writing a real note on every transition.

ProfileAlerts (0)Logout

LOANS

Active and closed loans across the book.

LOAN	BUSINESS	PRINCIPAL	OUTSTANDING	DISBURSED	STATUS
#787b0f3b	Blue Harvest Aquaculture (Pty) Ltd	R 750 000,00	R 750 000,00	26/09/2026	Disbursed
#46ed8c61	Blue Harvest Aquaculture (Pty) Ltd	R 750 000,00	R 750 000,00	25/09/2026	Disbursed

Figure 23 — Every loan on the book, with principal, outstanding, disbursement date and status.

Click a loan reference to open its account. This is the book-wide view; the Money tab is the same loan seen from its case.

16.2 Portfolio

Figure 24 — Portfolio health: total loans, active loans, total outstanding, and arrears.

Arrears lists every overdue instalment across the book. An empty arrears panel is the goal; anything in it needs collections attention.

Export CSV downloads the portfolio for reporting or reconciliation outside the system.

Check arrears before month end. Penalties accrue daily with no grace period, so a missed instalment gets more expensive for the client every day it is left. Early contact is cheaper for everyone.

17. Reports

Figure 25 — Reports. Five report groups, a period selector, and export.

Group	Contents
All reports	Everything on one page
Performance	Turnaround times, pipeline conversion, staff productivity
Portfolio & Risk	Exposure, arrears ageing, concentration
Compliance	Demographic and development-impact reporting
Activity	Audit and user activity

The two headline figures are **Average turnaround** in days and **Applications measured**. The period selector at the top right scopes everything on the page.

17.1 The charts

- **Pipeline Status Summary** — how many cases sit at each stage. Tall bars in the middle mean a bottleneck.
- **Origination Volume Trend** — value originated over time.
- **Pipeline Conversion** — how many cases made each transition. Where the bars narrow is where applications are being lost.
- **Staff Productivity** — tasks completed and applications handled, per person.

Reports are visible to management roles only — SuperAdmin, Admin, Program Manager and Board. Stage workers do not see this page, deliberately: it aggregates across cases they have no business seeing.

Previous

Page 1 of 3

Next

Figure 26 — User Access. Email addresses and names in this screenshot have been masked; the live screen shows real user details.

Four counters summarise the account base: visible users, internal users, clients, and admins. Search by name or email, and filter by user type or role.

18.1 Granting and removing roles

- **To grant:** choose a role in the **Assign Role** dropdown on that person's row and click **Assign**.
- **To remove:** click the **x** on the role chip.
- **Reset MFA** clears that user's authenticators so they can enrol a new device. Use when someone loses their phone.

18.2 The rules

Rule	Why
The Client role cannot be assigned here	It is granted by registering in the portal. Staff must not be able to make a colleague a borrower
Only a SuperAdmin may grant Admin	Administrative access is the keys to the system
Platform ownership is managed outside the app	Noted on the screen itself

This screen shows real personal data. Live email addresses and names of applicants and staff. Do not screenshot it into documents, tickets or chat without masking, and apply the same care you would to any personal information under POPIA.

Least privilege. Grant the narrowest role that lets someone do their job, and remove roles when people change duties. Every extra Admin is another account that can move money and change access.

19. My Profile and notifications

Figure 27 — Your profile. Name and phone are editable; email and roles are not.

Your **full name** is what colleagues see on assignments, notes and reports, so keep it accurate. **Phone** is optional. **Email** is managed by your sign-in and can only be changed by an administrator. **Roles** are shown for reference.

19.1 Notifications

The bell in the top bar carries a count of unread items. Notifications are raised on status changes, and by scheduled scans for arrears, due tasks and stale cases.

Notifications are in-app only. Nothing is emailed or texted, to staff or to applicants. If a case is waiting on someone, the system will not chase them — the dashboard SLA counter and the arrears panel are your early warning. Adding email delivery is item 3 in Section 23.

20. What the client sees

Understanding the applicant's view makes support calls much shorter. The Client Portal is documented in full in its own manual; this is the summary.

Their screen	What it shows
Landing page	A calculator quoting the cheapest rate, marked indicative
Eligibility check	Self-assessment against PRDF's criteria. Not recorded, not sent to you
Apply	Five steps: business profile, financials, loan details, documents, review
Consent declaration	Twelve POPIA, policy and terms statements, all must be YES
Home	Current application, three figures, recent activity
Documents	Their checklist, with your Verified/Rejected badges
Status	Six milestones, plus a repayment summary once funded
My Loans	Loan account, schedule and repayment history

20.1 Where their view differs from yours

- They see **six milestones**; you see **eleven stages**. Their timeline is a simplification.
- They see the rate as "from 15.50%" until the loan is booked; you see the actual grade.
- They cannot edit anything after submitting.
- They cannot pay through the portal.

Expect this support call. "The tracker says nothing has happened." While a case sits in Screening, Due Diligence, Evaluation, Board Approved or Contracting, the client's timeline shows every milestone greyed out — including "Application Submitted". Their status badge is correct; the circles are not. Reassure them and quote the status label. This is item 1 in Section 23.

21. Configuration without a release

The values PRDF revisits most are configuration, not code. Four of the six below need no developer and no deployment.

What	Where	Release?
Loan amount and term band	<code>loan_products</code> table	No
Which documents are required	<code>document_requirements</code> table	No
Prime rate and fees	<code>pricing_config</code> table	No
Risk-grade margins	<code>risk_grades</code> table	No
Eligibility criteria wording	Tenant config	Yes
Consent wording	<code>packages/domain/consent.ts</code>	Yes

21.1 Changing the loan band

Update the amount and term columns on the active product. Sliders, validation and the API all follow within about thirty minutes.

Narrowing a band has a delayed effect. A trigger validates applications against product limits on every write, so an already-submitted case outside a new band fails on its *next* update, not immediately. After narrowing, check for non-draft cases outside the new limits and re-quote them deliberately.

21.2 Changing pricing

`pricing_config` holds one row: prime rate, initiation fee, management fee percentage, penalty rate, penalty period and days per year. **When Prime moves, update it here** — the client-facing disclosure is expressed as a margin over Prime precisely so it stays true.

Existing loans are unaffected. Rate, fees and days financed are snapshotted onto each loan when it is booked, so changing config never re-prices a loan already sold.

21.3 Changing required documents

Add or remove rows in `document_requirements`. A brand-new document type also needs a label added in code, or the raw type name is displayed.

21.4 Changing consent wording

Edit the consent items and **bump the version stamp**, so stored consent records stay traceable to what was actually agreed.

The current consent wording is marked draft, pending PRDF legal review. It is captured and versioned correctly, but has not been signed off by legal. Item 2 in Section 23.

22. Environments and operations

22.1 Where things run

Component	Location
Admin Console	Vercel — <code>prdf-admin.vercel.app</code>
Client Portal	Vercel — <code>prdf-lms.vercel.app</code>
API	Vercel — <code>prdf-api.vercel.app</code>
Database, auth, storage	Supabase project <code>prdf</code>

22.2 Health checks

Check	Where
API alive	<code>/health</code>
Audit trail	<code>/api/reports/audit</code>
Deployment status and build logs	Vercel project
Database, auth and storage	Supabase dashboard

22.3 Two checks after any deployment

- Open the client portal signed out. If the calculator is blank, the portal cannot reach the API — almost always the API base URL setting.
- Sign in to the console and open any case. If it fails to load, the problem is the API or the token, not the console.

22.4 When something breaks

1. Capture the API logs around the time of the failure.
2. Capture the request ID and the failing endpoint.
3. Confirm row-level-security behaviour in the Supabase SQL editor.
4. Roll back to the previous deployment if production impact is high.

One production setting to verify. The API's JWT audience setting must be `authenticated`. During handover it was found holding a secret value instead, which causes every authenticated request to fail with 401 while unauthenticated pages keep working — a confusing failure that looks like a login problem. It has been corrected locally; confirm the production environment matches.

23. Known limitations

Stated plainly so that what is being signed for is clear. None of these stops an application being assessed or funded.

#	Item	Effect and recommendation
1	Client timeline goes blank mid-assessment	The portal's six milestones do not cover the internal stages, so a case in Screening through Contracting shows no progress to the applicant. Their status badge remains correct. Map the missing stages onto the milestones. <i>Highest priority — it generates support calls.</i>
2	Consent wording is draft	Captured and versioned, but not legally signed off. Have legal review it and bump the version.
3	Notifications are in-app only	Neither staff nor applicants are told anything outside the system. Add email or SMS on status change.
4	No password-reset page in the client portal	The reset email links to a page that does not exist. Applicants must ask PRDF to reset for them.
5	Repayments untested end to end	The repayment path against a bullet schedule has not been exercised. Verify with the first live repayment.
6	Upload size not enforced	Files go straight to storage, so neither portal nor API sees the bytes. Set a file size limit on the storage bucket — a setting, not a code change.
7	Client dashboard "amount outstanding" totals requested amounts	Can differ from the loan account. Treat the loan account as authoritative.
8	Term is collected in months, priced in days	A stated 3 months prices as 91 days against the model's 90 — about 1% more interest on that row. Deliberate: a 30-day month would under-charge a full year.
9	Loans booked before the pricing fix	Any loan booked before 26 September 2026 carries the legacy flat rate, an amortising schedule and no fees. These must be re-quoted or re-booked deliberately; the migration reports how many exist rather than rewriting them.
10	No multi-factor authentication requirement	MFA can be reset but is not enforced for staff. Consider requiring it for roles that move money.
11	No automated test suite	Regressions are caught by manual QA. Add end-to-end cover for the lifecycle and money paths.
12	Schedule dates display as raw timestamps	Cosmetic. Due dates render unformatted in both portals' schedule tables.

24. Acceptance and sign-off

This section records PRDF's acceptance of the Admin Console as delivered and documented in this manual.

24.1 Acceptance checklist

✓	Item	Section
☐	Staff can sign in; a Client-only account is correctly refused	4
☐	Dashboard counters and the assigned queue populate correctly	6
☐	Pipeline search and every status filter return the right cases	7
☐	A case opens with its rail, guidance and all eight tabs	8
☐	Documents can be viewed, verified and rejected	9
☐	Approval is refused while any required document is unverified	9.2
☐	Legal transitions succeed; illegal jumps are refused	5, 10
☐	The risk grade saves, drives the booked rate, and locks once booked	11
☐	A quote matches the worked example to the cent	12.4
☐	Late-payment penalties compute correctly at 30/60/90/120 days	12.5
☐	Disbursement pays the net advance and generates a bullet schedule	13
☐	A repayment records and reduces the outstanding balance	14
☐	History shows every transition with its note	15.1
☐	Tasks, Notes and Advisory entries persist	15
☐	Loans, Portfolio and arrears reflect the book	16
☐	Reports render and are hidden from stage workers	17
☐	Roles can be granted and removed; Client is absent from the dropdown	18
☐	Configuration changes take effect without a release	21
☐	The limitations in Section 23 have been read and accepted	23

24.2 Declaration

By signing below, PRDF confirms that:

1. The Admin Console described in this manual has been delivered and demonstrated.
2. The acceptance criteria in 24.1 have been verified.
3. The known limitations in Section 23 have been disclosed, read and accepted.
4. This manual, with the Client Portal User Manual, constitutes the system documentation.
5. The work is complete and accepted.
